

INFORMATION FOR CONTRIBUTORS TO *PHYSICAL REVIEW C*

(Revised January 1996)

Manuscripts which report the results of research in nuclear physics and related fields may be submitted to *Physical Review C*. The manuscripts must contain new results and not be in editorial process at another journal. (For details, see “Editorial Policies and Practices of *Physical Review C*” in this issue.)

Articles published in *Physical Review C* are grouped under **headings** in the table of contents. The headings now used are as follows:

Nucleon-Nucleon Interaction, Few-Body Systems
Nuclear Structure
Nuclear Reactions
Relativistic/Ultrarelativistic Nuclear Collisions
Subnucleon Aspects of Nuclei/Physics of Hadrons
Electroweak Interaction, Symmetries
Nuclear Astrophysics

Authors should suggest the headings which are most appropriate.

Information relevant to manuscript preparation and to the editorial process for this journal and other APS journals is available electronically via **ftp** to aps.org in the sub-directories `/jrnls`, `/pacs`, `/revtex`, etc., of the `/pub` directory. Most filenames include as an extension a suffix (beginning with a period), which indicates the nature of the file: `.asc` (plain ASCII), `.pdf` (portable document file, usable with Acrobat), `.ps` (PostScript), or `.tex` (TeX). Most files exist in two or three versions, distinguished by the suffix. Some specific files are cited where pertinent below. On the **World Wide Web** the APS server (whose URL is <http://publish.aps.org/>) also provides access to this material, and other information.

Manuscripts sent by **conventional mail** should be submitted in triplicate to the Editor, *Physical Review C*, 1 Research Road, Box 1000, Ridge, New York 11961. The author to whom correspondence is to be addressed should be specified and the telephone numbers, electronic-mail address, and FAX number at which the author can be reached should be given. If the manuscript is intended for one of the Short Paper sections (Rapid Communications, Brief Reports, Comments), this should be stated, preferably both on the cover sheet of the manuscript and in a covering letter.

Manuscripts and figures are *not routinely returned* to authors. Authors should indicate (preferably on initial submittal) if they want the manuscript and/or figures returned when cor-

respondence is sent during the editorial process, and/or after a final decision has been made.

A signed APS **copyright-transfer** form should be included with the submission, and will be required before publication. While the transfer of copyright takes effect only upon acceptance of the paper for publication in an APS journal, supplying the form initially can prevent unnecessary delays. The form appears at the end of the 30 October 1995 issue of *Physical Review Letters* and is available from the Editorial Office, on the World Wide Web via the URL <http://publish.aps.org/> or via ftp to aps.org in the `/pub/jrnls` directory as the `copy_trnsfr` files (include filename suffix `.asc`, `.ps`, or `.tex`). Be sure to use the latest (3/94 or later) version of the form.

Authors are also requested to supply **PACS** (Physics and Astronomy Classification Scheme) index categories. These categories are used in preparing the annual subject index. [The scheme is available via ftp to aps.org as the file `pacs_96.asc` in the `/pub/pacs` directory; the alphabetical index to PACS is available as the file `index_96.asc` in the same directory. Printed copies of PACS are available on request from the Editorial Office.] The Division of Nuclear Physics of the APS requests that authors provide a Keyword Abstract. A request will be mailed to the authors of experimental papers; the Keyword Abstract should be forwarded to the National Nuclear Data Center.

Manuscripts should be written in scientific English, in a style consistent with that of the journal. It is not possible for the editorial office to undertake extensive corrections of manuscripts, due to time constraints and the risk that the authors’ meaning might be distorted. Manuscripts requiring extensive corrections are therefore returned to the authors. For this reason, authors whose native language is not English are urged to seek help from a native English speaker. Manuscripts should be double-spaced (about 6 mm of space between lines) with ample margins, on white letter-sized paper. Poor copies and unclear or excessive handwritten inserts are not acceptable. For format and style, consult recent issues of this journal, the *Physical Review Style and Notation Guide*, and the Fourth Edition of the *AIP Style Manual*. Copies of the *Physical Review Style and Notation Guide* can be obtained via ftp to aps.org in the `/pub/jrnls` directory as the `style_guide` files (include filename suffix `.pdf`, `.ps`, or `.tex`). The *AIP Style Manual* may be obtained for \$10.00 prepaid from American Institute of Physics, c/o AIDC, 64 Depot Road, Colchester, VT 05546, telephone: 800-488-2665.

Electronic submissions (and inquiries about them) should be sent to the Internet address `prctex@aps.org`. The Editorial Office can use files formatted in LaTeX or REVTeX. For the initial submission, use as the subject “submit” followed by “prc” and the last name of the first author; for example, “submit prc jones”. Provide a conventional mailing address, and any other information needed, in the first part of the electronic-mail message. Manuscripts submitted electronically are assumed to be intended for compuscript production. The file must be in ASCII containing no control codes, with line lengths of 70 characters or less. All textual material of the paper (including tables, captions, etc.) should be in electronic form, as a single file. The file should produce double-spaced output. Receipt of an electronic submission will be acknowledged within 24 hours. Copies of the manuscript should *not* be sent by regular mail (only original figures) unless the electronic transmission has not been successful.

Editorial processing of an electronic-mail submission cannot begin until at least review-quality copies of the figures are received. Sending scanner-reproducible journal-quality “originals” immediately by overnight mail will meet this need, as will electronic-mail transmission (one figure per file) of PostScript-formatted figures (if the files can be successfully printed in the Editorial Office). Alternatively, review-quality figures can be forwarded by FAX (516-924-5294), while the “originals” are sent by conventional or overnight mail as soon as possible. Please mark the FAX transmission as being part of an electronic-mail submission.

Compuscripts are author-supplied computer files that can be used for production essentially as supplied. (Some minor style modifications may be made if needed.) If the paper is accepted for publication, the file is converted to SGML format and coding, from which base the journal pages are composed. Authors should indicate with their initial submission that they are interested in publishing in this mode. Appropriate REVTeX and LaTeX files are eligible. Questions about file eligibility should be directed to `prctex@aps.org`. Papers intended for the compuscript production program should be submitted and resubmitted by electronic mail or by DOS-formatted floppy disk.

REVTeX is APS’s LaTeX macro package used to produce the standard compuscript files for our journals. The REVTeX software (macros, examples, and documentation) is available via ftp to `aps.org` in the `/pub/revtex` directory. For further information on REVTeX, inquire by electronic mail to `mis@aps.org`.

When a manuscript is **resubmitted**, please include a summary of the changes made and a brief response to all recommendations and criticisms. If the resubmission is by conventional mail, please send three copies of a complete modified

manuscript; if changes are few, you may alternatively send three copies of those pages on which changes have been made (no more than three or four pages), but make sure that the page breaks are the same as in the initial manuscript. If the resubmission is by electronic mail, please send the complete file for the text if there have been any changes. (The response to the referee should be included as the first part of an electronic-mail message which contains the modified manuscript. Use as the subject of the message “resub” followed by the manuscript code number and the last name of the first author; for example, “resub cd1234 smith”.) For any resubmission, please state whether or not the figures have been modified, and supply new scanner-reproducible figures if there have been such changes.

The writing of the **title** deserves special care. It should convey the greatest amount of information in the smallest number of words. Words that do not carry information, such as “The...”, “A...”, “On...”, “Investigation of...”, “Study of...”, should be omitted. For manuscripts submitted to the Comments section, “Comment on...” followed by the title of the paper to which the Comment refers is, however, good practice. Do not use in the title words that praise the quality of the work (precise, important, accurate), the name of the accelerator or type of detector used, names of people or places, coined words or acronyms, “More about...”, “...revisited”, or dangling participles (...using...). Do not use serial numbers in titles unless the number is followed by a specific title, such as “Inelastic scattering of protons. IV. Coupled channels analyses.” If you wish to use a serial number, please provide information on the other published articles in the series.

The names of **authors** may be listed in any order in the byline at the beginning of a paper. Authors must be individuals, not groups or collaborations. The author who submits the paper is responsible for ensuring that all coauthors have approved the paper and for checking that the form of each name (e.g., initials versus full names) is that normally used by the author.

Affiliations of authors should be given without abbreviation. (Use Massachusetts Institute of Technology, not MIT.) Give the city, state, and zip code for U.S. addresses; add the country for other addresses. Affiliations must be institutions, not conferences, collaborations, or temporary meeting places.

If the authors are at different institutions, they may be grouped by institution with the name of the institution following each group. If the authors are not grouped by institution, the names of institutions may be repeated following the appropriate authors or groups of authors. If this becomes cumbersome, the names of institutions may be listed following the list of authors. Each author’s name should then be

followed by a superscript number (or numbers) which refers to a similar superscript number preceding the appropriate institution (or institutions). Normally, the most concise presentation is preferred.

Footnotes to an author's name or address will be limited to those which are necessary for proper identification or location of the author, or which designate an addressee for correspondence. Electronic addresses (e.g., Internet, FAX) are useful and can be listed as footnotes. Footnotes to an author's name which describe the author's position are not acceptable.

Every paper must have an **abstract**. It should be about 5% of the length of the article, but less than 500 words. It should state all subjects about which new information is given and the conclusions and results. For experimental papers it should specify clearly what quantities were measured, what nuclides were studied at what energies. It should not contain footnotes, coined words, or acronyms which are not explained.

Physical Review C tries to follow the recommendations on **symbols and units** of the International Union of Pure and Applied Physics (IUPAP) and of the National Institute of Standards and Technology. Metric units (preferably SI), not British units, are used, unless the British unit is part of the name of an object.

Recommended abbreviations for frequently used terms are listed below along with some common misuse.

Use	Do Not Use
μm	μ
nm	m μ
fm	F (F is for farad)
g	gm
A	amp
K	°K
sr	Sr, ster, str
u	amu
cm ³	cc
deg	DEG., deg.
keV	KEV, KeV
MeV	Mev, MEV
MeV/nucleon	MeV/u, MeV/amu, MeV/A
μ_N	n.m.
c.m. (=center of mass)	CM

Physical Review C follows the recommendations of the S.U.N. Commission of IUPAP on the symbols to be used for nuclides and their states. The nucleon number (mass number) of a nuclide is shown as a left superscript (¹⁴N). A right

superscript is used for indicating a state of ionization (Ca²⁺) or an excited state (¹¹⁰Ag^m, ¹⁴N*). A right subscript is used for indicating the number of atoms in a molecule (¹⁴N₂). For bombarding particles, *n*, *p*, *d*, *t*, *h*, and α may be used, but not τ . For other bombarding particles, only the usual symbols ⁶Li, ¹²C, ... should be used. For target nuclides, use ¹H, ²H, ³H, ³He, ⁴He, ... Do not use D, T, ...

The preferred notation for a differential **cross section** is $\sigma(\theta)$, $\sigma(E, \theta)$, i.e., the angle or energy should be shown as an argument. The derivative notation $d^2\sigma/d\Omega dE$ is acceptable; $d^2\sigma$ by itself or $d\sigma/d\Omega dE$ is not. The notation dM/dA or ds/dZ is acceptable when it refers to a mathematical relationship, such as the semiempirical mass formula, but not for the characterization of data, since *A* and *Z* are not continuous.

Notation should be clear, compact, and consistent with standard usage. Each symbol must be individually legible. Equations should be neatly typed or written in ink, numbered on the right. Tildes, carets, etc., can be put on any symbol, including indices, but not over groups of symbols. Double oversymbols (e.g., a caret over a tilde) should be avoided. Three-vectors are printed in boldface, unit vectors in boldface with a caret. More general vectors and matrices are usually set in lightface type but may be set in boldface. (To indicate boldface, use a black-penciled wiggly underline.) Any numerical fraction can be put on line, e.g., $\frac{1}{2}a$. Use that form rather than $a/2$; $1/2a$ means $1/(2a)$.

References cited in text material must be numbered in order of their first citation, and should appear in a separate double-spaced list at the end of the text. They should be designated by on-line Arabic numerals enclosed in square brackets. **Footnotes** (for subsidiary remarks, not for references) may be placed at the bottoms of printed pages. Such footnotes to text material should be designated by superscript numerals, numbered consecutively throughout the paper, and placed at the bottoms of the manuscript pages on which they are cited. Authors who do not wish to use this option should combine references and footnotes in a single list, designated by on-line numerals in square brackets, numbered consecutively in order of first citation, and placed at the end of the text. References and footnotes within tables should be designated by superscript lower-case roman letters and given at the end of the table.

In preparing the **list of references** for papers submitted to *Physical Review C* the author should be guided by the *Physical Review Style and Notation Guide*, especially Table I and the list of Journal Title Abbreviations, and by the corresponding material in the *AIP Style Manual*. The following describes the practices of *Physical Review C*:

et al. The use of *et al.* (no comma before *et*) is encouraged in the body of the paper, but discouraged in the references. The names of all authors should be given in the references, unless the number of authors is greater than **ten**.

(in press) means that the paper has been accepted for publication in a journal (or a conference proceedings). The name of the journal must be specified. If the paper has been published when the author receives the proofs, the reference should be updated in proof.

(submitted or to be submitted) means that the paper has been submitted or will shortly be submitted for publication. The name of the journal, book, or conference proceedings must be specified.

(unpublished) means that the information is unavailable in printed form. Ph.D. theses need not be marked (unpublished), since copies can be purchased.

Conference Proceedings. Name, place, and year of the conference should be specified. Specify the editors and publisher if possible. Give page number.

Reports. Give name of laboratory, report number, and year. Give the title if possible and especially if a report number is not available.

Books. Give publisher, year, page number.

Journal references. Phys. Rev. C **20**, 195 (1979). Nucl. Phys. **A249**, 253 (1978). (Note difference.) For Annals of Physics use Ann. Phys. (N.Y.).

(private communication) means that the information is not available either in published or report form and acknowledges the receipt of information from another source. References to private communications in which the name of one of the authors appears are not acceptable.

It is important to confirm the accuracy of bibliographic information in references. This will become more important in the future when journals are online; establishing hyperlinks from reference lists to bibliographic and document databases depends on the accuracy of the data contained in the anchor reference.

Acknowledgments of support must be placed in an acknowledgments paragraph at the end of the text of a manuscript.

Not all types of acknowledgments are appropriate for the *Physical Review*. We do not include acknowledgments to

those who helped in the preparation of the document being published; to referees or editors (unless they were involved before the paper was first written); to those who contributed general encouragement (family, friends) or services which were not directly part of the research. References to positions, titles, and awards are inappropriate as are dates associated with awards. Examples of suitable acknowledgments are thanks to other scientists for scientific guidance given in discussions or by the communication of results, mention of technical assistants who helped in the actual research, and citation of funding agencies which sponsored the work. Acknowledgments should be a simple statement of thanks for help and may not be a dedication or memorial. Acknowledgments to people should precede those of financial support.

Separate **tables** (numbered in the order of their appearance) should be used for all but the simplest tabular material; they should have captions that make the tables intelligible without reference to the text. Units should be given in the column headings. The decision on whether results should be published in long tables depends on the precision of the data, i.e., whether they can be read accurately enough from a figure, and on how many readers are likely to use the numbers relative to the space needed in the journal. If experimental results are likely to be used as reference values by other authors, the publication of the numbers is desirable. If additional numerical data can be obtained from a data center, from the author, or another source, either as tables or in electronic form, indicate how and in what format they can be obtained. Authors should consider the feasibility of depositing extensive tabular material in the Physics Auxiliary Publication Service (PAPS) of the American Institute of Physics. This material will usually be included in the Microfilm edition of the *Physical Review*. For details, write to the Editors' office. Authors may prepare tables in camera-ready form, even if the rest of the paper is not so prepared. This practice is encouraged for long tables. Such tables must be similar in appearance to tables composed at the American Institute of Physics.

Figures should be planned for the column width of the *Physical Review* (approximately 8.6 cm). If the detail shown requires it, $1\frac{1}{2}$ or 2 columns may be used. A note should be left on or with such figures. High-quality scanner-reproducible figures must be supplied. Legible duplicates should be attached to each of the manuscript copies. Figures should be numbered in the order in which they are referred to in the text. They should be identified on the *front* (outside the image area) by the number, the name of the first author, and the journal. An indication, e.g., "TOP," of the intended orientation of a figure is helpful, especially in ambiguous cases. Be advised that the scanner reproduces all imperfections (e.g., correction fluid, tape, smudges, writing on the back of the figure). Each figure must have a caption that makes the

figure intelligible without reference to the text; list captions on a separate sheet. Text should be placed in the caption, not on the figure. Groups of figures that share a (single) caption must be labeled “Figure 1(a), 1(b),” etc.

Figures must be prepared so that all details can be seen in reproduction. The smallest symbols must be at least 2 mm high after the figure is reduced for reproduction; plotted points should be at least 1 mm in diameter after reduction. Avoid small open symbols which tend to fill upon reduction, small dots, and small decimal points. If similar quantities are to be plotted several times, such as angular distributions at several energies, do not enclose each graph in a box but use instead shifted ordinate scales for each plot and enclose all the plots in one large rectangle. Graphs with large areas that are either blank or contain only text are not acceptable.

The figure itself should have labeled axes with units enclosed in parentheses. Use the form $R(10^3 \Omega)$, not $R \times 10^3 \Omega$. Use half spacing within compound units. Avoid ambiguous usage of the solidus (“/”) [e.g., use (mb/MeV sr), not (mb/MeV/sr)]. For complete instructions see the *Physical Review Style and Notation Guide* or the *AIP Style Manual*. When possible, integer numbers should be used on the axis scales of figures (e.g., 1, 2, 3, or 0, 5, 10, not 1.58, 3.16, 4.75). Decimal points must be on the line (not above it). Use 0.5 not 0·5. Use the same number of digits to the right of the decimal point for all numbers on the axis scales. A number must be both before and behind the decimal point. Use 0.2, not .2.

A schematic line drawing showing the experimental equipment or layout is often helpful, but photographs or artist’s renderings of apparatus are not acceptable.

Figures might be more effective in **color**. This option is available; price schedules can be obtained from the Editorial Office at Ridge. The cost of publishing illustrations in color must be borne in full by the respective authors and their institutions. Authors who wish to avail themselves of this option should provide 35-mm slides or transparencies, or high-quality glossy prints, which should be close to the final size expected for publication. (Negatives are not acceptable.) Polaroid color prints should be avoided. Artwork must be flexible. If submitting slides, please note that they will be removed from their jackets for the color separator. In some cases, printing requirements will prevent color figures from being located in the most preferred position.

To alert readers of monochrome reproductions of the article that the archive figure is in color, begin the caption with “(Color).” Be advised that production of an editorially accepted paper that contains color can begin only after a properly completed color-illustration authorization form has been received from the authors.

The relation of the paper to **previously published** work should be explained clearly. This should include the work of other authors and previously published work of the present authors, including meeting abstracts and conference reports. If the present results correct, supplement, or supersede previous results, this should be stated. (Preprints and internal laboratory reports are not considered publications.) Indicate which results are new, as distinguished from results obtained previously.

In order to **reproduce** figures, tables, etc., from another journal, authors must show that they have complied with the requirements of the publisher of the other journal, possibly including written agreement of both publisher and author of the originally published work. (If the original journal is published by APS, only the written agreement of the original author is required to reproduce a few figures or tables.)

Enough information about the **apparatus** and methods should be presented to permit evaluation of the procedure. For example, for a scattering experiment, give relevant dimensions, target thickness and composition, energy resolution, and angular resolution. If an accelerator was used, it should be identified.

An example of **data** should be presented (such as an energy distribution, time-of-flight spectrum, or coincidence spectrum) to show the quality of the data. If results depend on theoretical assumptions, state what the assumptions are. If the measurement is relative to a standard, such as an energy or cross section, state what reference value was used. If results depend on a sign convention, state the convention and give references.

Specify **uncertainties**. Distinguish statistical and other errors. In the case of measurements relative to a standard, state whether the error includes the error in the standard.
