

Reconstruction of sunspot activity since 850 AD from ^{10}Be concentration in Antarctic (red) and Greenland (green) ice cores. The black line starting at 1610 shows recorded sunspot counts, and the horizontal bars point to various minima & maxima. This 3-fold extension of the sunspot record into the past reveals that the high solar activity since 1940 is unique over the past 1,150 years. See article 211101.
