In the abstract and in the second-to-last paragraph on page 4 we state that the measurement of the ^{24}MgI$(3s3p)^3P_2$ lifetime of 2050^{+140}_{-110} sec to our knowledge is the longest lifetime ever determined in a laboratory environment. Since the publication of our Letter it has come to our attention that the longest lifetime measured in a laboratory environment is in fact the one presented in [1], in which the authors determine the lifetime of the first excited state of helium to be 7870 ± 510 sec.
